

SPOTTING

- Spotting is normal

Remember, the beneficial minerals have been conditioned and left in your water. These conditioned minerals will be easier to wipe up than unconditioned minerals, however if water is left to evaporate continuously on hard surfaces, scale will begin to form. The solution is to not allow water to evaporate on hard surfaces.

- Glass shower doors

Years of scale formations on glass doors can etch the surface of the glass and cause soap and minerals to stick in those fissures. Using RainX® or a similar product in addition to a squeegee on shower doors can seal pores on the glass surface causing water to sheet. This greatly reduces spots and scale formation.

- Dishwasher

In leaving the beneficial minerals in your water this may cause some occasional spotting on dishes and glassware. We recommend using Lemi-Shine© liquid rinse aid. This is an all natural product and will not leave any chemical residue behind.

- Toilets

HALO Water is highly filtered to remove chemicals and disinfectants. When exposed the open atmosphere of a toilet bowl the water can grow mildew and bacterial. This is especially true with low flow toilets that do not fully flush away deposits and toilets that are unused for extended periods of time. Use a product such as CLR to remove deposits. Flush 'n Sparkle® is a recommended to introduce chlorine to ONLY the toilet bowl without the chlorine effecting the toilet gaskets, flapper or other components.

HARDNESS (TDS)

- Total Dissolved Solids

TDS is the measurement of all dissolved solids in your water, including but not limited to minerals. The conditioning process alters the scale forming minerals so they are no longer aggressive or harmful, but hardness tests cannot determine the difference between conditioned minerals and raw minerals and are ineffective in determining the performance of the HALO conditioning system. The TDS may increase slightly during the descaling process.

- Boiling or Vaporizing Water

When boiling or vaporizing conditioned water and you may see white deposits form on the bottom of the pan or appliance. This is a normal reaction between conditioned minerals and extreme heat. If this causes a problem for humidifier or vaporizer use distilled water or contact the manufacturer for more information.

- Slippery Water

The HALO Conditioning System uses no sodium or potassium. This is why you will not experience that slimy, slippery feeling on your skin and hair. The slippery feeling is caused by chemical additives. Instead the HALO Conditioning System provides you with bottled water quality water.
